

DEVELOPER PIPELINE PLAYBOOK | ENGLISH EDITION

Are your project leads sales-ready, or just contact details?

A diagnostic guide for developers and project sales teams that need buyer conversations with CRM context, not more campaign noise.

Use this playbook to identify where project demand loses quality before sales can act, then decide whether a Pipeline Audit is the right next step.

A diagnosis tool, not a free funnel plan.

This playbook is built to surface whether your current lead system creates sales context or only contact details. It gives enough structure to identify the problem, not a complete implementation plan that replaces a proper diagnosis.

Developers with a concrete launch, project or sales pressure

Relevant when you need sharper sales context before the next call.

Project sales teams receiving enquiries but missing buyer context

Relevant when you need sharper sales context before the next call.

New-build or investment teams that need cleaner CRM handover

Relevant when you need sharper sales context before the next call.

Teams considering Build+Run but not yet sure where the leak sits

Relevant when you need sharper sales context before the next call.

If this situation is concrete, a Pipeline Audit is more useful than another set of general marketing ideas.

This playbook is a diagnostic lead magnet. It is not a promise of lead volume, revenue, delivery timing or legal compliance, and it does not include a full funnel blueprint, media strategy or scoring model.

Demand only becomes pipeline when sales can act on it.

The operating question is simple: does your system capture the right signal, qualify intent, hand context to the CRM and create a clear next step for sales?

If one part of this logic is unclear, it should be reviewed in the audit before more budget is pushed into reach.

The actual problem: enquiries without sales context

Developer campaigns often look active while sales still works manually. The funnel collects names, brochure requests or vague project interest, but the CRM does not explain why this person matters now. More traffic then creates more sorting work instead of more qualified buyer conversations.

- A project enquiry is not sales-ready just because it has a phone number.
- A buyer who likes the architecture may still be far from timing, budget or decision readiness.
- A campaign that reports leads without CRM feedback cannot show where real buyer intent starts.
- If sales has to rebuild the context on every first call, the handover is not doing its job.

Where does your sales team currently lose time: before the call, during the call or after the lead enters the CRM?

Typical project pipeline leaks

Most weak project funnels do not fail in one dramatic place. They lose quality in several small handovers: from ad to page, from page to form, from form to CRM and from CRM to follow-up. The leak is commercial, not cosmetic.

- The page explains the project but not the buying decision.
- The form captures contact details but not project fit, timing or buyer type.
- The CRM record shows a source but not the reason for urgency.
- Follow-up starts the same way for every lead, regardless of readiness.
- Reporting focuses on cost per lead while sales still filters manually.

Which of these leaks can you prove is under control today?

What a sales-ready project lead must show

A sales-ready project lead gives the first call a useful starting point. It does not need to reveal every detail, but it should show enough context for sales to decide whether to call, how to open the call and what next step makes sense.

- Project or location interest is visible before sales opens the record.
- Buyer type, unit logic or use case is at least directionally clear.
- Timing and budget proximity are not hidden in free-text notes.
- Source, landing page and requested asset are connected to the record.
- The next step is obvious enough that follow-up can start without guesswork.

If your CRM does not show this context reliably, is the lead weak or is the handover incomplete?

Mini scorecard: audit readiness

Audit readiness does not mean the system is already strong. It means the business has a concrete enough situation to diagnose: project, market pressure, current lead sources, sales process and a real commercial reason to improve lead quality.

- There is a specific project, launch, stock pressure or market area.
- Leads already exist, but sales cannot trust or prioritize them cleanly.
- The CRM or lead management process is visible enough to inspect.
- Sales can explain which leads waste time and which create real conversations.
- Budget and decision readiness can be discussed without pretending the audit is free consulting.

Can you name the project, lead problem and sales bottleneck in one sentence?

Symptoms worth reviewing, not a full solution

This playbook intentionally stops before a complete blueprint. A serious project funnel depends on market, offer, assets, sales capacity, CRM maturity and timing. Generic advice can create activity while the real bottleneck remains untouched.

- High lead volume but low booked-call quality points to weak qualification.
- Many brochure downloads but few serious conversations points to unclear next steps.
- Fast follow-up with poor outcomes points to bad fit, not only bad sales execution.
- Slow follow-up points to ownership, CRM and process gaps.
- Low trust in reports points to missing definitions between marketing and sales.

Which symptom is expensive enough that it deserves diagnosis before more media spend?

What the Pipeline Audit clarifies

The Pipeline Audit is not a free strategy workshop. It is a focused diagnosis of whether a Build+Run mandate makes sense and where the current system loses commercial quality before sales can act.

- Where project demand enters the system and where context is lost.
- Whether the landing page and lead asset attract the right buyer type.
- Whether intent filtering protects sales time or only adds friction.
- Whether CRM handover gives sales enough context for the first call.
- Whether follow-up and reporting can support at least three months of Run.

Which audit question would be uncomfortable to answer from your current data?

When the audit fits and when it does not

The audit is useful when there is a real project, sales pressure and willingness to build a system. It is not useful when the goal is only to collect free ideas, demand a lead guarantee or avoid CRM and sales discipline.

- Fit: active project, launch pressure, internal sales ownership and budget readiness.
- Fit: existing lead sources that produce volume but not enough usable context.
- No fit: no concrete project, no sales function or no willingness to operate the system.
- No fit: expectation of guaranteed lead numbers or a full funnel plan from a free call.

Are you trying to diagnose a commercial bottleneck or only gather more marketing ideas?

Clear next step: audit the lead system

If the scorecard exposed a real gap, the useful next step is not another generic checklist. It is a 30-minute diagnosis of the current system and a decision on whether Build+Run is commercially sensible.

- Use the audit to test whether the system is missing funnel logic, qualification or CRM handover.
- Bring one concrete project, market area or lead-quality problem.
- Prepare the current lead sources, CRM process and biggest sales bottleneck.
- Expect a clear assessment, not a free implementation plan.

Should your next move be more traffic, or a diagnosis of why current demand is not becoming pipeline?

NEXT STEP

Have your current lead system reviewed.

If you have a concrete project, market area or lead-quality problem, the Pipeline Audit is the next step. We review funnel logic, intent filtering, CRM handover and follow-up readiness. No free full funnel plan. No lead guarantee. Clear diagnosis before proposal.
